What We Owe Workers as a Matter of Common Humanity: Sickness and Caregiving Leaves and Pay in the Age of Pandemics

Abstract

Workers commodifying their time in labour markets are liable to become temporarily incapable of doing so because of sickness or caregiving responsibilities. While the risk is universal, it will be experienced very differently depending on social conditions and arrangements and social locations, such as gender, among others. In a society in which the vast majority of people are dependent on labour market incomes to survive, the consequences of being off work are severe, unless some protection and benefits are provided. Over time, Canada has developed a number leave and income-replacement schemes, but the COVID-19 pandemic revealed, in dramatic fashion, their limitations, leading to the adoption of temporary measures to address the crisis. This article, written from a feminist political economy perspective, provides an overview of the historical development of sickness and caregiving leave and pay arrangements set against the background of changing social and economic reproduction regimes. It then examines more closely the slow development of Canada's welfare state model of sickness and caregiving leaves and benefits since the 1970s, focusing on the federal government's enactment of special employment insurance benefits and statutory leave rights in British Columbia and Ontario. Next, it critically examines the limitations of that statutory regime, as it existed immediately prior to the outbreak of the COVID-19 pandemic in Canada, and then considers the expansion of sick and caregiving leave and pay provisions, enacted in response to the pandemic. The article then elaborates four principles to guide the future development of the sick and caregiving entitlements suggests ways of bringing the existing regime more into line with those principles. Finally, it sets out a few directions towards imagining a different regime that truly provides workers with what we conceive they are owed as a matter of common humanity.

The law permits [temporary illness] on the ground of common humanity to be
offered as an excuse for not discharging duty temporarily and suffers the disabled
party to recover wages for the time he is temporarily away from work.1

THE COVID-19 PANDEMIC HAS tested the limits of many areas of law and they have
been found wanting. Sickness and caregiving leaves, paid and unpaid, are one,
and as those limits quickly became apparent, all Canadian jurisdictions expanded
workers’ leave rights and the federal government created income replacement

1. Dartmouth Ferry Commission v Marks (1904), 34 SCR 366 at 374, Davies J.
schemes for workers taking these leaves.\(^2\) Suddenly, entitlements that seemed beyond the realm of the politically possible were enacted into law with little resistance.Perhaps it took a pandemic for us to rediscover or, at least, expand the scope of our common humanity.

A discussion of what is owed workers as a matter of common humanity might proceed purely as a normative discussion, but that is not our intention. Rather, we come at this issue from a feminist political economy perspective; we are interested in exploring regimes of sickness and caregiving leaves through an examination of their role in mediating the endemic conflict in capitalist regimes between the imperative of continuous and limitless capital accumulation and social reproduction, or the activities centrally involved in life making. At least since industrial capitalism, social reproduction has been separated from market production. However, this separation does not alter the fact that production for the market remains dependent on social reproduction. The capitalist economy cannot survive without people engaging in the multitudinous activities of social reproduction, by which we mean the daily and intergenerational reproduction of life.\(^3\) Yet while it is a condition of its existence, the capitalist economy, to quote

\(^2\) The changes to sickness and caregiving leads were part of a broader scheme to address mass unemployment, but our focus here is on the leaves.

\(^3\) We use the term social reproduction to refer to daily and intergenerational reproduction, in the widest sense. This encompasses training, development and the continued well-being of workers for the labour process, and “the general standard of living, education and health sustained in society.” Linda Clarke, “Disparities in Wage Relations and Social Reproduction” in Linda Clarke, Peter D. Gijsel & Jörn Janssen, eds, The Dynamics of Wage Relations in the New Europe (Kluwer Academic Publishers, 2000) 134 at 137. Institutions with a common interest in reproducing the working population include, but are not limited to, the state, the education system, the public sector, the family, firms, and trade unions. Social reproduction occurs at inter- and intra- household levels through unpaid work; at the level of the nation state through direct and indirect government transfers; and internationally through processes of migration. The international level affects temporary migrant workers in Canada acutely, creating a process whereby host states, like Canada, externalize the costs of labour supply renewal in various ways, including the cost of providing for unemployment and other income disruptions, as well as the cost of raising and training the next generation of workers for the labour market. See Leah F Vosko, “Rethinking Feminization: Gendered Precariousness in the Canadian Labour Market and the Crisis in Social Reproduction” (Chairholder lecture delivered at the Robarts Centre for Canadian Studies, Toronto, 2003) at 19, online (pdf): <www.genderwork.ca/modules/precarious/papers/vosko.2002.rethinking.pdf> [Vosko, “Rethinking Feminization”]. On migration and social reproduction, see especially Michael Burawoy, “The Functions and Reproduction of Migration Labor: Comparative Material from Southern Africa and the United States” (1976) 81 Am J Soc 1050; Saskia Sassen, “Towards a Conceptualization of Immigrant Labor” (1981) 29 Soc Probs 65.
Nancy Fraser, “accords [the activities of social reproduction] no monetized value and treats them as if they were free.”

That said, the worlds of production and social reproduction are intimately intertwined. Workers commodifying their time in labour markets have always needed some time off paid work, whether due to illness or injury, or because of childbirth, or because they have other caregiving responsibilities. In short, all paid workers are engaged in social reproduction to one degree or another. Of course, the extent of that engagement is deeply gendered as well as racialized and shaped profoundly by migration status, age and (dis)ability. Women carry the burden of childbirth and, albeit not inevitably, both historically and contemporaneously of domestic work and childcare as well. But the gendering of labour market participation and caregiving work is not a constant. For example, in the past fifty years in Canada, women’s labour market participation has increased dramatically and men’s patterns of participation have changed with the spread of precarious employment—and yet, on account of their continuing responsibilities for caregiving, women’s total work (including paid and unpaid) continues to exceed that of men. At the same time, labour market incomes have stagnated such that in two-adult households, taken to be the norm at the level of law and policy, both adults must commodify their time to achieve or maintain a decent standard of living. And this has occurred within a context in which caregiving responsibilities are increasingly privatized, with the burden of that caregiving (both paid and unpaid) still falling on women, in the sphere of paid work falling

6. On caregiving models, see e.g. Nancy Fraser, “After the Family Wage” (1994) 22 Pol Theory 591.
disproportionately on racialized im/migrant women, including those engaged in precarious domestic work in households and beyond. All these changes shape how conflicts between production and social reproduction are experienced and how they are mediated by legal and social arrangements, including sick and caregiving leaves and pay for workers.8

So, when we ask what workers are owed as a matter of common humanity, we do not take “common humanity” as an unchanging legal or social norm. Rather, we understand the answer to the question of what workers are owed as a legal right or social practice results from changing economic, political and ideological forces that operate at multiple scales—the national, subnational, and indeed transnational. It is also a realm in which the politics of class, gender, migration status, and other social relations are intertwined and intersect, given the inevitable juggling of work in labour markets and in social reproduction, where conflicts are experienced most intensely by low-wage workers who are disproportionately female, racialized, lacking permanent residency status, etc.

To this point, we have abjured engagement with the normative question of what we owe workers as a matter of common humanity. However, that is not to say that we come to this discussion without a view. To the contrary, we associate ourselves with an emancipatory project that aims to drastically reduce working time (paid and unpaid), to dramatically improve its quality and to weaken, if not sever, the link between work and access to the resources necessary for a sustainable process of social reproduction.9 That said, while we believe it is

8. Although our focus here is the provision of sick and caregiving leaves and pay in Canada, the alternative regime which we envision is inclusive of migrant workers, including those confronting high degrees of temporariness (e.g., temporary foreign workers lacking definitive prospects for return), neglected under the current system. In this context, it is useful to recall Sassen's formative intervention on migrant workers' prominent role in production for surplus and their facilitation of social reproduction by permanent resident and citizen workers in host states, such as Canada. Migrant workers often labour under dangerous and exploitative conditions, enabled by legal structures that deprive migrant workers of labour mobility, capacity for collective action, and the benefit of entitlements that many permanent resident and citizen workers can obtain. We, and others, have dealt in some detail with these issues elsewhere. See e.g. Kendra Strauss, “Social reproduction and migrant domestic labour in Canada and the UK: Towards a multi-dimensional concept of subordination” in Vulnerability, Exploitation and Migrants (Palgrave MacMillan, 2015); Malcolm Sargeant & Eric Tucker, “Layers of Vulnerability in Occupational Safety and Health for Migrant Workers: Case Studies from Canada and the UK” (2009) 2 Pol’y & Prac in Health & Safety 51; Leah F Vosko, Disrupting Deportability: Transnational Workers Organize (ILR/Cornell University Press, 2019); Sarah Marsden, Enforcing Exclusion: Precarious Migrants and the Law in Canada (UBC Press, 2018).

important to expand the imaginary of what we can and should demand, we wish to focus on something that is within reach right now: a permanent expansion of protected sick and caregiving leave entitlements and access to income while away from work. To advance that project, we identify four principles (universality, sufficiency, security and worker-centred flexibility) that should provide the foundation for constructing such leaves and benefits.

The article unfolds in four parts. We begin Part I with an overview of the historical development of sickness and caregiving leave and pay regimes, starting with the common law and then turning to statutory measures at the end of the 1960s, chronicling a period in which the male breadwinner/female caregiver model reached ascendency. However, by that time fault lines were quickly surfacing and the dual breadwinner/female caregiver model began to take shape, resulting in mounting tensions in social reproduction. In the second segment of our historical narrative, we examine the slow development of Canada’s welfare state model of sickness and caregiving leaves and benefits over the next five decades, focusing on the federal government’s enactment of special employment insurance benefits and statutory leave rights in British Columbia and Ontario, in response partly to these tensions. Part II critically examines the limitations of that statutory regime, as it existed immediately prior to the outbreak of the COVID-19 pandemic in Canada, in light of the imperative towards universal breadwinning alongside further privatization of (still gendered) caregiving. Part III considers the expansion of sick and caregiving leave and pay provisions, enacted in response to the pandemic. We conclude by elaborating on the four principles identified above that we believe should guide the development of the sick and caregiving entitlements we owe workers as a matter of common humanity and suggest ways of bringing the existing regime more into line with those principles. Finally, we set out a few directions towards imagining a different regime that truly provides workers with what we conceive they are owed as a matter of common humanity.

I. THE HISTORICAL DEVELOPMENT OF SICK AND CAREGIVING LEAVES AND PAY REGIMES

A. THE COMMON LAW IN THE ERA OF THE MALE BREADWINNER/FEMALE CAREGIVER MODEL

Since history does not have a beginning, the starting point of an historical account is necessarily a somewhat arbitrary decision, although in our case it is simplified because of our concern with sick and caregiving regimes under capitalism,
beginning with the rise of industrial capitalism in late eighteenth-century England. However, one cannot understand capitalism’s common law without at least some understanding of its earlier roots, and so we must say a few words about the master and servant regime in pre-modern England.

It is impossible to speak of a singular legal regime governing work in that earlier era. Apprentices in the guild system operated under one regime, domestic servants in another, agricultural workers in another, et cetera. Deakin and Wilkinson argue that there was no general law of employment until well into the twentieth century. However, there are a few unifying themes that can help us understand the judgment of common law courts in the industrial era. There was not the same radical separation of production for the market and social reproduction that marked the wage system of industrial capitalism. Since work was not as sharply delineated from the rest of life as it was to become, there was not as great a conflict between production and social reproduction. Work was more task oriented and not strictly regulated by the clock. As well, most work contracts were of fixed duration; seven years for apprentices; a presumption of annual hiring for agricultural labourers, and so on. As a result, most employers could not terminate work contracts simply by giving notice. Cause was required, which might include disobedience or permanent incapacity, but it did not include temporary illness, as long as the servant remained willing to fulfill their obligations when able to do so.

The unwillingness to treat temporary illness as relieving the master of its obligations to the servant was also rooted in the still prevailing idea that the contract of employment was a contract of mutuality, an idea closely tied to that of common humanity. As long as workers remained willing to work as they were able, they were not dishonouring their contracts. Therefore, employers remained bound to honour their most foundational contractual duty, the duty to pay. Moreover, most work contracts were entire contracts, which meant that any breach of the contract by the worker would relieve the employer of the duty to pay for the entire period of the contract. If mutuality had any meaning, then surely the temporary inability to work due to illness should not relieve the employer of its duty to pay.

Finally, operating in the background was the poor law system under which parishes were responsible to provide the necessities for impoverished workers and

---

their families with residence. Relieving the employer of its duty to pay shifted the cost of supporting workers and dependent family members onto the parish.

It is against this backdrop that we can begin to understand the common law’s early response to sickness pay in the mid-nineteenth century. The leading English case was *Cuckson v Stones*, although notably the case did not involve a labourer but a master brewer employed under a ten-year contract. Stones, the brewer, became ill toward the end of the contract, and was off work for several months until he was able to return and complete his service. His employer, however, deducted his wages for the period he was off work due to illness. Stones sued and won. The court relied on older case law, including some maritime cases (involving a distinct legal regime governing the work of seamen) and some settlement cases (involving which settlement was responsible to support the worker under the poor laws). The court held that Stones was entitled to recover because workers are only required to provide such service as they are able to provide and thus a temporary illness does not relieve the employer of the duty to continue to pay wages during the period of temporary disability. Although in this case, the employer had not terminated the contract, the parties accepted that a temporary illness also did not provide cause for terminating the contract.13

The Supreme Court of Canada relied on this principle in the *Dartmouth Ferry* case, quoted at the beginning of the article. In that case, the plaintiff, Jane Marks, a widow, sued for wages she claimed the employer owed her husband for time he was off work sick. However, Mrs. Marks lost because her husband’s illness was permanent and fatal, allowing the employer to treat contract as frustrated and at an end, including their obligation to pay wages.

While the common law adopted a generous approach to temporary sick leaves and pay, its attitude toward caregiving was quite different, perhaps because the plaintiffs were women, not bread-winning men. The leading case on this point is *Turner v Mason*, which involved a domestic servant, Ms. Turner, whose master denied her permission to leave the house for the night to attend to her severely ill mother who was in danger of dying.14 She went anyway and, upon her return the next morning, her employer summarily dismissed her and refused to pay for the month. Ms. Turner sued for her wages but was unsuccessful. The judges were unanimous. This was a clear case of disobedience, which the daughter’s caregiving responsibilities and human need to be with her dying mother did not

12. (1859), 120 ER 902 (KB).
14. (1845), 153 ER 411 (Ex).
TUCKER, VOSKO, MARSDEN, WHAT WE OWE WORKERS  673

The common law’s common humanity, it seems, was quite limited.

Yet, even where the law appeared to extend common humanity to workers by providing them with paid sick leave, its reach was quite limited. Stones and Marks were not ordinary industrial workers, but highly skilled senior employees on long-term contracts. Most industrial workers were, at best, on contracts of indefinite duration, terminable at any time and for any reason by giving reasonable notice. While notice entitlements were meaningful for upper-echelon workers, employers could terminate industrial workers on hourly wages with minimal amounts of notice. Moreover, nothing prevented an employer from terminating temporarily ill workers by giving notice. Sick leave, therefore, was entirely at the discretion of the employer and, even if the employer granted leave and permitted the worker to return to work, the promise of the common law’s right to be paid while off sick was unlikely to be honoured. This is because the common law merely establishes default rules that can be defeated by express contract or custom, as was its default rule on sick leave and pay.

For example, under industrial capitalism, workers who were temporarily unable to work due to work-related injuries and disabilities had no legal entitlement to be paid while off work, whether by legal presumption, express contract or custom. Some workers sought compensation from their employers in tort, claiming their employers’ negligence caused their disability, but the common law judges would have none of it. Relying on market principles, not common humanity, the judges created a legal presumption that workers voluntarily assumed the risk of injury by agreeing to perform the work.17

The gap between the common humanity promised by the common law and the protection it delivered was disruptive for social reproduction under industrial capitalism. By the mid-nineteenth century, the male breadwinner model had become the principal way in which most working-class families gained access to the resources they needed to survive. The disablement of the male breadwinner, therefore, was a threat to the family’s survival. The failure

15.  Ibid at 413.
16.  Ibid.
17.  The earliest English case is Priestly v Fowler (1837), 150 ER 1030 (Ex). For a discussion of the Canadian law of employers’ liability, see Eric Tucker, Administering Danger in the Workplace (University of Toronto, 1990) at ch 3.
of the common law to provide compensation for work-related injuries fueled worker discontent, giving rise to class-based politics that attracted support from social reformers and a politics of social protection. This combination helps explain why workers’ compensation laws enacted in the early twentieth century created the first legislative entitlements to sick leave and pay, albeit limited to work-related injuries.  

The need for protected leaves and paid time off work, however, did not just arise in the context of job-related work injuries. Although its frequency is variable and its distribution is far from uniform, all human beings are liable to suffer from sickness and injury that require recovery time. Under the male breadwinner/female caregiver model, these events disrupt access to the income on which the worker and any dependents rely. In the absence of meaningful common law or statutory entitlements, workers sought private solutions. While more research is needed on benefits during the first half of the twentieth century, we know that some unionized workers secured days of paid sick leave and short and long-term health-related insurance benefits. Other workers obtained benefits through the growth of “corporate welfare” programs designed to build employee loyalty and avoid unionization.

Caregiving leaves, however, were likely quite rare. The male breadwinner/female caregiver model assumed there was an unpaid housewife available to fulfill the family’s caregiving responsibilities. The unencumbered male breadwinner did not require caregiving leaves. For similar reasons, leaves related to pregnancy and childbirth leaves were not a high priority. In the normal course, pregnant women were expected to leave the paid labour force permanently, only to return if the male breadwinner became disabled or left the home. Of course, this was not true for all workers, but it was the normative model upon which sick and caregiving leaves and pay were based until the late 1960s.

19. For a prescient discussion of the issue and a call to provide social insurance that would cover sickness and maternity, see Leonard Marsh, Report on Social Security for Canada (1943), new ed (McGill-Queen’s University Press, 2017) at 21 (“Particularly when [illness] strikes the breadwinner, however, it is also a problem of the interruption of earning power. A serious and prolonged illness means not only medical or hospital bills, but destitution if there are no sources to fill the gap created by the cessation of wages” at 21).
Labour market insecurity, and its implications for social reproduction, is obviously not limited to earnings interruptions due to sickness and caregiving responsibilities. In the twentieth century, workers began to press the state to enact measures to address these problems. Workers’ compensation, discussed above, was among the first legislative schemes enacted to protect interruptions of labour market incomes. It took several decades of struggle and the upheaval caused by the Great Depression to move the federal government to enact a general scheme of unemployment insurance in 1935. The courts held the federal government lacked jurisdiction to enact such a scheme, which necessitated a constitutional amendment before a valid scheme came into force in 1940.\(^{21}\) The normative male breadwinner model was interrupted by World War II when women were recruited into industrial workplaces to replace the masses of men conscripted into military service, but at the war’s end women were pushed out and the model was restored.\(^{22}\) Again, we emphasize that the model was normative, rather than universal, based on a set of assumptions about the gender contract that informed public policy. In the case of unemployment insurance, the program gradually became more gender neutral on its face from the 1950s onwards.\(^{23}\) However, it still pivoted on the male norm of the standard employment relationship, and has never fully accommodated the reality of workers engaged in forms of part-time and temporary paid work, let alone self-employment. As well, certain

\(^{23}\) Two key exceptions were the short-lived “married women’s regulation,” which disqualified women from unemployment insurance automatically for two years after marriage unless they demonstrated strong labour market attachment, and the exclusion of “fishermen’s wives.” See Barbara Neis, “From ‘Shipped Girls’ to ‘Brides of the State’: The Transition from Familial to Social Patriarchy in the Newfoundland Fishing Industry” (1993) 16 Can J Regional Sci 185; Ann Porter, *Gendered States* (University of Toronto Press, 2003) at 118, 125.
groups of workers engaged in seasonal employment ill fit the regime and, while they gradually gained coverage, they rarely qualified for full benefits.24

By the late 1960s, however, the normative male breadwinner/female caregiver model contract was coming undone. Women’s labour force participation rate, which had sunk after World War II to less than 25 per cent in the early 1950s, began to increase, so that by 1970 it reached 40 per cent and continued to rise steadily until the late 1980s, slowing but still crossing the 80 per cent threshold in the early 2000s.25 This is not to suggest that women engaged in the labour force on the same basis as men, or that the labour market as a whole was not changing in significant ways. Amongst other developments, the standard employment relationship (i.e., full-time permanent employment on the employer’s premises under direct supervision paid by a social wage) began to erode over this period, particularly in the wake of the oil shocks of the late 1970s. The feminization of employment, or as Vosko prefers, gendered precariousness,26 was an important phenomenon that shapes the development and impact of sick and caregiving leave and pay policies throughout this period. As well, household composition was changing, marked by an increase in lone-parent-headed households, four-fifths of which were headed by women in 2015.27

These developments, in conjunction with the ongoing problem of income disruption due to illness and disability and the privatization of caregiving of various sorts, childcare, eldercare and healthcare chief among them, generated a crisis of care, predominantly borne by women who, despite returning to paid labour, still performed (and continue to perform) the majority of caregiving work.28

28. Moyser & Burlock, supra note 5.
Some employers responded to their employees’ needs to take time off for sickness by providing paid sick days, even in the absence of a statutory duty to do so, while others acceded to collective bargaining demands from their unionized employees. While we do not have data on the availability of employer-provided benefits in the last decades of the twentieth century, by 2016, according to data from Statistics Canada’s General Social Survey, about 42 per cent of employees reported having paid sick leave. However, access to paid sick leave varied significantly by industry (e.g., education and public administration higher than hospitality and construction), occupation (white collar higher than blue collar), education (university educated higher than high school or lower) and visible minority status (non-visible minority higher than visible minority).29 Another study, based on an online survey in 2019, found that employers paid 38 per cent of illness or disability leave and 23 per cent of family responsibility leaves. However, the proportion of paid leaves varied significantly by income decile and job type (higher paid and permanent employees being far more likely to have paid leaves than lower paid and casual or seasonal employees).30 Finally, the results of a 2019 survey of British Columbian workers were similar. Less than half had employer-provided paid sick leave, with access varying depending on income, job type, unionization, immigration status and indigeneity, among others.31 The shortfall in voluntary or negotiated arrangements, particularly for those most disadvantaged, continues to fuel demands for statutory rights to leaves and benefits.

Limited access to employer-provided benefits failed to solve the growing crisis of caregiving, which put pressure on the Canadian state to address the shortfall. An early response was to provide households comprised of Canadian citizens and permanent residents with greater access to low-wage, racialized domestic workers through migrant worker programs. Beginning in the 1960s and extended significantly in the 1970s, these programs targeted, in particular,

30. David Macdonald, “COVID-19 and the Canadian Workforce” (CCPA, March 2020) at figures 1 & 2. Some employers offer flexible work arrangements, although the incidence is unclear. See Employment and Social Development Canada, Flexible Work Arrangements: What Was Heard (September 2016), online: <canada.ca/en/employment-social-development/services/consultations/what-was-heard.html>. The responses cannot be read as representative since nearly 75 per cent of the respondents were federal employees.
women from the Caribbean and the Philippines, to ease the burden of socially reproductive labour and enabling and normalizing a dual-earner model among Canadian citizens and permanent residents.\textsuperscript{32} These vital migrant workers were afforded constrained access to long-term/permanent residency and its rights and associated entitlements, which precluded them from being accompanied by their own dependents initially and for an extended period, in effect shifting major aspects of the crisis of caregiving onto their shoulders and overseas communities.\textsuperscript{33}

A second branch of the Canadian state’s response was to create and then incrementally expand federal employment insurance (EI) caregiving benefits, often matched with amendments to employment standards laws, to provide covered workers with protected unpaid leave rights.\textsuperscript{34} In the remainder of this section, we briefly trace these developments.

Table 1 provides an overview of the development of sick and caregiving leaves and benefits. Although maternity and parental leave benefits are not a focus in this article, we have included them here because they are important for understanding the historical development of these kinds of provisions. As Table 1 shows, with one exception, the development of sickness and caregiving leaves, broadly defined, begins in the 1970s. As well, we can see these leaves and benefits developed in two waves. The first, roughly from 1970 to 1990, straddles the shift from the era of Keynesian-style welfare state expansion (marked by the creation of public health insurance in 1966) to the period of growing neo-liberal austerity (marked by the imposition of wage and price controls in 1976). The second wave begins around the turn of the twenty-first century, a period in which neoliberalism was definitively ascendant, characterized by the dual imperative towards universal breadwinning and the further privatization of (still gendered) caregiving.

\textsuperscript{34} Ironically, many of these benefits and leaves would not be available to foreign domestic workers who were, in any event, required to leave their children and other dependents in their home countries as a condition of their entry into Canada.

The first wave of leaves and benefits addressed sickness and maternity and parental responsibilities. EI sick benefits were created in 1971 at the same time as maternity benefits. As we saw earlier, at one level, the need for sick benefits was the result of the failure of the common law's presumption of a contractual entitlement to sick pay for most workers. The resulting problem of income disruption due to illness in the male breadwinner/female caregiver model remained acute in two-earner and single parent situations. At another level, a perfect storm was brewing around the expansion of unemployment insurance in such directions, denoted by the flurry of government reports and white papers on unemployment insurance beginning in 1962. As well, the Royal Commission on the Status of Women (RCSW), appointed in 1967, issued its report in 1970, which documented how women in the labour force, both in the public and private sector, were compelled to use sick days/leave to cover some of their maternity leave. It also found that women used more sick leave than men because of various family responsibilities and underscored the tight connection between sickness and women's poverty. By drawing attention to these interactions, the RCSW reinforced pressure on the government to introduce both sickness and maternity benefits in the same Bill. The women's and labour movements lobbied hard for legislation, which resulted in the enactment of the 1971 EI amendment providing sickness and maternity benefits.\(^{35}\)

With regard to sickness, the legislation provided up to fifteen weeks of benefits after a two-week waiting period.\(^{36}\) The Liberal government enacted the law over the unanimous opposition of employer groups and the vehement objections of some parliamentarians.\(^{37}\) However, the provinces did not immediately follow up by enacting statutory sick leave rights to protect the jobs of workers collecting sick benefits. It was not until 2000 that Ontario enacted protected sick leaves and BC only in 2020.\(^{38}\) Prior to statutory sick leaves, an employer could have

---

36. Prior to 1971, a 1955 amendment to the unemployment insurance scheme enabled workers who became temporarily sick while collecting unemployment to continue to do so; see SC 1955, c 50.

37. Pal, supra note 19 at 78-80.

38. Ontario's statutory sick leave rights were reformed by the Liberal government in 2017 to provide for up to two paid sick days, but the Conservative government repealed and replaced this provision in 2018. See Employment Standards Act, 2000, SO 2000, c 41 [ESA, 2000]; SO 2017, c 22, Sched. 1; SO 2018, c 14, Sched 1. For BC, see SBC 2020, c 6.
terminated a worker off work temporarily because of sickness by giving notice. Moreover, prior to 1981 in Ontario and 1984 in BC, their human rights codes did not prohibit discrimination based on disability, and, in any event, the prohibition against discrimination on the ground of disability does not apply to “ordinary” illnesses, like the flu.

The creation of maternity benefits aimed to eliminate policies explicitly discriminatory to women, by beginning to accommodate the reality of women’s labour force participation during pregnancy and after childbirth. Like those providing for sickness, they provided up to fifteen weeks of benefits, again with a two-week waiting period, providing income security which in BC and Ontario supplemented existing unpaid maternity leave entitlements for maternity.

The creation of the EI maternity benefit was an important but limited breakthrough, reflected in the requirement that to qualify, a woman had to have a “major” attachment to the labour force and satisfy the so-called “magic ten” rule designed to ensure she was working at the time she became pregnant. That rule was modernized but not eliminated in the 2010s when, under the hours-system inaugurated in 1996 (pegging qualifying requirements to hours rather than weeks worked in a modest attempt to include workers engaged in a wider variety of forms of paid employment), qualifying requirements were reduced from seven hundred to six hundred hours after a court challenge.

Evidence of the slow pace at which governments changed caregiving and benefit policies to accommodate the reality of dual earner and single-parent families is the nearly twenty-year gap between the creation of maternity leaves and parental leaves. While maternity leave accommodated a woman’s recovery from childbirth, parental leave addressed the need to care for infants and newly adopted children. The Canadian Union of Postal Workers pioneered the struggle for parental leaves, successfully striking for such a benefit in 1981. The National Action Committee on the Status of Women, created partly to promote the recommendations of the RCSW, also lobbied heavily for parental benefits, and published a study in 1985 that emphasized its importance in view of the growth

of women’s labour force participation and the two-earner family. The failure of the federal government to develop a national childcare strategy exacerbated the caregiving crisis. The state’s initial response was quite limited. In 1990, the federal government added ten weeks of parental benefits that could be taken by either parent or split between them. The provinces supported these EI entitlements (and their subsequent expansion) with matching statutory leave rights.

The second wave of benefit and leave rights began at the turn of the twenty-first century, at a time when governments focused more on shrinking the welfare state than expanding it. For example, the federal government rolled back EI by making it more difficult to qualify, sharply reducing the percentage of the unemployed eligible for benefits. Against this backdrop, and reflecting the growing crisis of care, the state modestly expanded caregiver benefits and leave rights, beginning in 2000, with an extension of parental EI benefits from ten to thirty-five weeks. Provinces followed up by increasing protected parental leaves to fifty-two weeks.

Other caregiving needs, however, were addressed, if at all, more slowly and in more limited ways. BC first provided five days of unpaid protected family and emergency leave in 1995. Ontario followed suit in 2000, providing ten days of leave, but only in workplaces with fifty or more employees. In both BC and Ontario, leave could be taken to attend to the medical needs of family members, as well for “urgent” personal or family matters. As well, in Ontario the leave could be used for personal sickness, but that was not the case in BC. While these leaves might have provided a foundation on which to expand sickness and

47. Ontario provided eighteen weeks of unpaid leave in 1990 (SO 1990, c 26) and BC twelve weeks in 1991 (SBC 1991, c 3).
caregiving entitlements, matched by EI benefits, that was not the case. Instead, the federal government created new caregiving benefits and leaves to address only the direst circumstances.

The first of these was the Compassionate Care benefit, introduced by the Conservative federal government to take effect in 2004. The benefit provided six weeks of EI benefits for eligible workers taking time off to provide care for their gravely ill or dying child, parent or spouse, but like other EI benefits, they required a two-week waiting period. The same year, Ontario created a family medical leave to protect the job rights of covered workers taking such leaves, and BC provided similar leave protection in 2006. To be eligible for either of these, workers must provide medical documentation that the person for whom they are providing care faces a significant risk of death within twenty-six weeks. Since their creation, the duration of the benefit has been increased to twenty-six weeks (matched by protected leave rights) and the range of included caregiving relationships been broadened. However, the “significant risk of death” requirement remains.

The 2012 federal family caregiver benefit effectively expanded the Compassionate Care benefit to provide care for a family member whose baseline state of health has changed significantly because of illness or injury and, as a result, their life is at risk. The government makes clear that this benefit is not available for chronic health conditions, unless the person’s health changes significantly because of a new and acute life-threatening event. The benefit initially was only available to care for critically ill children, but in 2017 it was extended to care for adults (eighteen and over), although with fewer weeks (up to thirty-five for children; fifteen for adults). Ontario enacted two corresponding leave entitlements in 2014. The first, the critically ill child leave, complemented the federal benefit, while the second, the family caregiver leave, covered a much wider range of circumstances. It provided eight weeks of unpaid leave to care for a family member, broadly defined, with a serious medical condition, including a chronic or episodic condition. The leave could be taken without there being a serious risk of death. Then, in 2017, in response to the expansion of the federal family caregiving benefit under EI to critically ill adults, Ontario extended the critically ill child leave accordingly. BC only provided leaves corresponding to the federal family caregiver benefits in 2019.

In sum, governments initially responded to the breakdown of the family breadwinner model and the urgent need to address the reality of women’s labour

force participation by providing maternity benefits and leaves for eligible women. This intervention barely touched the surface of caregiving needs, but it took nearly twenty years until government addressed another, narrow slice of them, parental benefits and leaves to care for newborn and newly adopted children. Provincial governments began to address other caregiving responsibilities in a limited way through unpaid leaves for which no EI benefits were available. When the Federal government did expand special EI benefits for caregiving, they opted to do so only for end-of-life or critical illness situations.

We explore the limitations of this bundle of benefit and leave provisions in the next section of this article.52

II. THE ERA OF UNIVERSAL BREADWINNING AND STILL GENDERED CAREGIVING PRIOR TO THE COVID-19 PANDEMIC

As the preceding section has shown, some support for illness and disability is relatively longstanding, whereas caregiving, beyond the relatively narrow coverage of the parent-child relationship in the early years of life, has only recently been included in the basic package of minimum standards and social insurance benefits for workers. In this section, we offer a critical examination of contemporary support for both types of leave—sick and caregiving—considering federal employment insurance benefits and protected leave rights in Ontario and British Columbia.

These benefits and rights are framed as universal in the sense they serve as a floor for the many workers who do not have access to collective bargaining or beneficial employment contracts. Functionally, however, leaves entitlements under the federal employment insurance benefits, in particular, are far from universal. Many workers long marginalized in the labour force are excluded by way of eligibility and/or entry requirements that rely on anachronistic and deeply gendered assumptions about what constitutes “work,” who qualifies as a “worker,” and the degree to which supports for the daily and intergenerational

52. We do not examine in this article another avenue for accommodating caregiving responsibilities or family status discrimination. It provides that, in very limited circumstances, an employer is under a legal duty to accommodate an employee’s family caregiving responsibilities. In BC, family status discrimination only applies to caregiving for children and the employers’ duty only arises in extremely limited circumstances. See Envirocon Environmental Services ULC v Suen, 2019 BCCA 46; In Ontario, the duty covers child and eldercare, and the test for establishing the duty to accommodate is less stringent than in BC. See Misetich v Value Village Stores, Inc, 2016 HRTO 1229.
reproduction are necessary for continued well-being of workers engaged in the labour force. Alongside these exclusionary features, we consider the sufficiency of available supports to maintain an adequate standard of living, which arguably represents a form of partial exclusion.

A. SICKNESS BENEFITS AND LEAVES

Under federal Employment Insurance, sickness benefits, which are the second most significant in volume among special benefits, provide income replacement in the case of injury, illness or quarantine. Some workers, however, are ineligible—specifically, self-employed workers who have not registered for special benefits or have been registered for fewer than twelve months. Workers who are otherwise eligible may be excluded at the point of entry, by way of hours requirements in the case of employees, and via earnings requirements in the case of registered self-employed workers in good standing (i.e., who have paid premiums for twelve months). To be eligible, workers who are employees must have accumulated six hundred hours of insurable employment in the fifty-two weeks preceding the claim and those that are self-employed must meet an equivalent minimum earnings requirement (e.g., those qualified to claim benefits in 2020, had to earn a minimum of $7,279 in 2019). These entry requirements are most likely to disadvantage the most precariously employed workers who are disproportionately women, youth, recent immigrants, rural workers, and sales and service workers.

For workers that qualify, the basic benefit rate is set at 55 per cent of the recipient’s average insurable earnings (based on a formula that accounts for the best earning weeks and the level of unemployment in the region) up to the maximum insurable earnings (which was $54,200, or the equivalent of $573

53. In 2019, just as family caregiving leaves beyond the parent-child relationship came on stream, sickness benefits accounted for approximately 31 per cent of new special benefit payouts, ahead of maternity benefits, which represented approximately 20 per cent, and following parental benefits, which accounted for approximately 47 per cent, not surprisingly since parental benefits can be sustained for much longer periods than sickness benefits. See “Employment insurance benefit characteristics by class of worker, monthly, unadjusted for seasonality” at table 14-10-0007-01, online: Statistics Canada <www150.statcan.gc.ca/t1/tbl1/en/tv.action?pid=1410000701> [perma.cc/Y57Y-H9RF].

54. Until 2010, only employees were eligible for sickness benefits. At that time, self-employed workers who are citizens or permanent residents of Canada were given the option of registering for special benefits and paying an equivalent amount in premiums as regular employees. For details, see “El Special Benefits for Self-employed People: Overview” (6 April 2020), online: Employment and Social Development Canada <www.canada.ca/en/services/benefts/ei/ei-self-employed-workers.html> [perma.cc/5N9R-4V8S].

a week in 2020). Because benefit rates are based on earned income, they are lower for workers who earn less, whether due to relatively low hourly wage rates, relatively low weekly hours, or employment contracts of short duration in which, once again, workers historically marginalized in the labour force are likely to be overrepresented. The impact of dimensions of labour market insecurity, particularly low wages, on sickness benefits is one of many ways in which certain social groups shoulder a disproportionate share of the impact of falling real wages, growing precariousness in employment writ large, and increasing wealth polarization. By way of example, an employee working in Vancouver at a minimum wage ($13.85 an hour) part-time job (25 hours a week) would have earned $346.25 weekly during the qualifying weeks, and would be entitled to a (wholly insufficient) sickness benefit of $190.44 per week.

Workers in low-income households with dependent children are eligible for a family income supplement, increasing the maximum benefit rate that a single individual in that household can receive from 55 to a maximum of 80 per cent. While originally attached to the income of the individual worker, the supplement now is pegged to family income on the assumption that resources are shared in households. However, it is long-documented that this assumption disadvantages women, who represent the majority of low-income beneficiaries. Furthermore, the low-income supplement is not available to families without dependent children, regardless of financial need or presence of dependents such as elders. This narrow conception of dependency limits access to the low-income benefit and may thereby amplify the marginalization of social groups of workers long marginalized in the labour force (e.g., older workers, recent immigrants living in multigenerational households et cetera).

On a positive note, sickness benefits provide some flexibility and opportunity for increased income for those who are able to perform some paid work despite their condition: eligible workers may retain fifty cents for every dollar earned

56. Employment Insurance Regulations, SOR/96-332, s 34 [EI Regulations].
up to 90 per cent of their weekly insurable earnings. In circumstances where they exceed fifty cents for every dollar earned, income from sources such as self-employment, workers’ compensation, group health insurance or wage replacement, and retirement income, may be deducted from these benefits but income from other sources, such as disability benefits and survivor or dependent benefits, may be retained.

While federal sickness benefits provide partial short-term income replacement for a subset of workers, they do not address job security—that is, provide for job-protected leave—during a period of illness; instead, provincial employment standards laws play this role for most workers. In Ontario, employees who have been employed for a minimum of two weeks are entitled to three unpaid sick days annually, with the right to return to their position and protection from dismissal for taking the leave. Prior to the COVID-19 crisis, BC’s employment standards had no sick leave whatsoever, but, in March of 2020, it added a three-day provision alongside the COVID-19 specific leave we discuss below.

There is a substantial mismatch between EI sickness benefits and leave protection. On the one hand, the Employment Standard Act (ESA) leave entitlements may fail to protect workers collecting EI benefits. For example, EI is available to some self-employed workers, but they have no protection against contract termination because of taking time off for sickness. As well, an eligible worker fulfilling qualifying requirements may receive up to fifteen weeks of EI benefits, but their job protection ends after three days. Indeed, because of the one-week waiting period before EI benefits begin, workers will likely have lost their leave protection before they start collecting them.

On the other hand, ESA leave rights may be available to workers who cannot collect EI benefits. For example, leave rights kick in for covered employees after

61. Approximately 10 per cent of workers are employed by federally-regulated private sector employers and subject to a parallel federal legal regime, which we do not discuss in this article.
62. ESA, 2000, supra note 36, ss 50-53. Sickness entitlements have been contentious: The prior Liberal government provided a more open-ended personal emergency leave of ten days, two of which were paid. The current Conservative government repealed the entitlement to two paid leave days and divided personal emergency leave into three unpaid sick days, three unpaid personal emergency days and two unpaid days for bereavement. See SO 2018, c 14, Sched 1, s 19.
two weeks of employment, but they may not have accumulated sufficient hours to collect EI. It also follows that because of the mismatch, workers taking advantage of the three-day protected leave have no statutory entitlement to income support during this time. This absence will discourage workers who do not have collective bargaining or contractual entitlements to pay from taking sick leave and will most affect workers historically marginalized in the labour force.

The collective consequences of inadequate sick leave and the exclusion of large numbers of workers from income support while sick came into sharp relief during the COVID-19 pandemic, an issue that we revisit in the final segment of this article exploring the potential for long-term change to sick leave policy.

B. CAREGIVING BENEFITS AND LEAVES

As we have seen, caregiving benefits and leaves, beyond those associated with the birth and infant care needs of a child, are relative newcomers to the bundle of entitlements flowing from paid work. However, both benefits and leaves are limited to specific, well-documented circumstances where either terminal or critical illness of another person is involved.

The Compassionate Care benefit, discussed earlier, is available to eligible workers who take time off work to care for terminally ill family members. While originally limited to parents, spouses, and children and providing income support for six weeks, in 2016 benefits were extended to twenty-six weeks and the scope of eligible relationships expanded to include many immediate and extended family members, as well as any person who is “like a close relative” in relation to the worker. As with sickness benefits, workers must have engaged in 600 hours of insurable employment in the fifty-two weeks preceding the claim; they must also demonstrate that their regular weekly earnings from work have decreased by more than 40 per cent for at least one week due to caregiving for a family

---

64. We do not address the issue of exclusions and special rules that limit workers’ employment standards coverage entitlements here. For an examination of this important issue in Ontario, see Mark Thomas et al, “The Employment Standards Enforcement Gap and the Overtime Pay Exemption in Ontario” (2019) 84 Labour/Le Travail 25; Leah F Vosko, Andrea Noack & Mark Thomas, How Far Does the Employment Standards Act, 2000, Extend and What Are the Gaps in Coverage?: An Empirical Analysis of Archival and Statistical Data (Queen’s Printer for Ontario, 2016).

65. As discussed above, human rights protection against discrimination will only be available to workers whose illnesses qualify as disabilities, and tribunals have held that this label does not attach to ‘ordinary’ illnesses like flu.

66. Self-employed workers fulfilling the same requirements as those established under other special benefits are eligible for these benefits. See EI Regulations, supra note 54.
member or equivalent person. A medical certificate confirming likelihood of death, as well as an attestation form from the family member with regard to the relationship, are also required.

Family caregiver benefits, also discussed earlier, are available on parallel bases, in the case of critically ill adults for up to fifteen weeks, and critically ill children for up to thirty-five weeks. A worker claiming the benefit must provide a medical certificate stating that the person they are caring for is critically ill and requires support of a family or family-like member. The certificate must also indicate the anticipated duration of the support period.

For both types of benefit, the level of income replacement is similar to that for sickness benefits (55 per cent of best weekly income up to a maximum, plus a low-income supplement available to eligible claimants in low-income families) with all the attendant problems discussed earlier. As well, there is a one-week waiting period before benefits are available. Finally, it is important to emphasize the limited circumstances in which these benefits are available: end of life care and critical illnesses and injuries where the patient’s life is at risk and there has been a significant change in the patient’s baseline state of health.

On a positive note, all three caregiving leaves can be shared between multiple caregivers—even more than assumed typically in the case of parental leaves—and claimants can decide how to divide the weeks themselves. Caregiving benefits can also be claimed at any time during the fifty-two-week benefit period and claimants can opt to stagger their benefits or serve them concurrently.

71. Employment and Social Development Canada, Section 2: 22.2.9, supra note 68.
Provincial job security provisions are much better coordinated with federal income support in the case of caregiving than is the case with sickness. As discussed earlier, both Ontario and British Columbia enacted caregiving leave entitlements to match EI entitlements. These leaves effectively provide job security to workers relying on federal income security benefits in two specified instances of caregiving: for terminally ill and critically ill family members or persons with whom one has a family-like relationship. In both provinces, the definitions of illness and list of included family members are also designed to cohere with those under federal income support programs for critical and terminal illness.  

There are, however, some mismatches between EI benefits and leave protections. First, some workers will qualify for EI caregiver benefits but will not be entitled to protected leaves while they are off work. For example, in Ontario (but not BC), employees are only entitled to take Critical Illness leaves (which match Family Caregiver EI benefits) if they have been employed by their current employer for at least six consecutive months. Thus, some Ontario workers who qualify for the benefit will not qualify for the leave because they do not have six months of consecutive employment with their current employer. As well, self-employed workers cannot qualify for protected leaves even though they have registered for EI and meet its qualifying conditions for special benefits. The reverse is also true: some workers qualify for leaves but not EI benefits. One example is Ontario’s Family caregiving leave to care for family members with serious medical conditions, for which there is no EI benefit. Thus, workers must be able to afford to take this leave without income replacement. Another situation arises in relation to compassionate care benefits. Neither BC nor Ontario place any duration of current employment qualifications on taking the matching provincial leaves and BC does not place any such requirement to access Family caregiver leaves. As a result, there will be many employees entitled to such leaves who do not qualify for EI benefits because they do not meet its 600-hour requirement. For these employees, the leave entitlement is impractical unless they can afford to take it without any income replacement, affecting most severely those workers who are the most marginalized and precarious.

While the shortfalls we have identified in the design of the current regime are serious, rectifying them would not be enough. The problem is more deeply rooted and lies in the regime’s core assumption that sickness and especially caregiving responsibilities are not the norm, but rather are exceptional events that can be addressed through narrowly defined and restrictive benefits and leaves.

72. *ESA, 2000*, supra note 36, ss 49.3-49.5; *Family Member Regulation*, BC Reg 137/2019.
73. *ESA, 2000*, supra note 36, ss 49.4(2), 49.4(5).
The regime treats caregiving work performed outside of the labour force as an aberration from the desired norm of full-time, permanent, paid employment, in which care work remains necessary, but is assumed to be absorbed without cost, often by workers long marginalized in the labour force. Limiting caregiving benefits and leaves to terminal and critical situations falls far short of meaningful recognition of the multiple forms of caregiving work that are central to the lives of workers and to social reproduction generally.

While the recognition of illness, for some fifty-years in the case of EI, and the fairly recent recognition of caregiving beyond the parent/infant relationship is a welcome start, the COVID-19 crisis opens space for—and underscores the necessity of—making radical, rather than incremental, and indeed ad hoc, reforms. Indeed, it presents an opportunity to construct a new, inclusive regime, which reconceives what is “standard” to reflect the lived realities of diverse workers and which reverses the trend toward universal commodification in ways that are materially beneficial to all workers.

III. TEMPORARY MEASURES RESPONDING TO THE 2020 COVID-19 CRISIS

Shortly after the World Health Organization declared COVID-19 a global health pandemic, the federal and provincial governments likewise declared states of emergency, locking down non-essential aspects of Canada’s economy. Simultaneously, in recognition of the limits of sick and caregiving leaves and challenges to accessing regular benefits in the face of massive full or partial layoffs, the federal government announced the Canada Emergency Response Benefit (CERB), and followed-up in late spring with a related but lesser benefit for students enrolled or just completing post-secondary education premised along similar principles.74 A taxable benefit, the CERB provided recipients with a taxable benefit of $2000 dollars a month ($500 dollars a week) for a maximum duration of sixteen weeks in the period between March 15 and October 3, 2020. It required no waiting period so that applicants received their first payment within ten days of applying.

The CERB was available to workers (paid employees and the self-employed) who: (a) reside in Canada (including non-citizens and permanent residents with

a valid Social Insurance Number) and are at least fifteen years old; (b) stopped working because of reasons related to COVID-19, or who qualified for EI regular or sickness benefits, or who had exhausted their EI regular benefits between December 29, 2019 and October 3, 2020; and (c) earned at least $5,000 in 2019 or in the twelve months before they applied. This included income earned outside of Canada, as well as income from EI pregnancy or parental benefits. It did not include income earned from disability benefits such as ODSP, CPP-Disability or WSIB loss of earnings benefits.

In addition, workers who earned up to $1,000 per month (before taxes) while receiving were eligible for the CERB—that is, able to keep that income in addition to the $2,000 CERB benefit.

“COVID-19 related reasons” included some caregiving responsibilities, including taking time off work to care for a family member with COVID-19 or, being a parent, to care for children due to school closures. The CERB covered situations outside the parameters of EI caregiving benefits and, in any event, was more accessible because of the reduced qualification for the CERB.

The CERB also interacted with EI sickness benefits. Workers in receipt of sick benefits prior to March 15 continued to receive those benefits. Applicants whose claims for sickness or quarantine started after March 15 received the CERB. If their sickness or quarantine was COVID-19 related, they did not need to qualify for EI benefits to receive the CERB. If their sickness was not COVID-19 related, then they still needed to qualify for benefits, but were not required to provide a medical certificate and the normal one-week waiting period would be waived.

Simultaneously, provinces like British Columbia and Ontario amended their employment standards legislation to provide leave entitlements during declared emergencies and infectious disease emergencies. These laws provided employees with unpaid leave entitlements if they are not performing work because of emergencies declared under provincial emergency powers legislation or for reasons related to a designated infectious disease. Reasons include that the employee is under medical investigation or treatment, is acting pursuant to an order of a health authority, is in quarantine pursuant to an order, or is providing care or support to a family member, broadly defined. The leave lasts for as long as the employee is not performing work because of one of the above reasons. Employers may require employees taking such a leave to require reasonable evidence that they are entitled to the leave, but cannot require a medical certificate.75

75. ESA, 2000, supra note 36, s 50.1, as amended by SO 2020, c 3; Employment Standards Act, RSBC 1996, c 113, s 52.12.
There is much to commend the CERB and its associated leave protections. Our focus here is just on its relation to pre-existing sick and caregiving benefits and leaves. There are several features that constituted an improvement over that regime. First, there were no hours-of-work or attachment to one’s current employer requirements of the kind that characterize the existing regime. Second, the CERB provided a flat $500 a week entitlement, which was lower than the maximum EI entitlement of $573 but greater than the EI entitlement of 84 per cent of claimants laid off prior to the COVID-19 crisis.76

Yet, despite these and other improvements, the response was still firmly rooted in the assumptions of the pre-existing model. For example, there was still a labour force attachment qualification. While a $5,000 earnings level before ceasing work may not seem like a high barrier, it disproportionately affected those most precariously employed and those who already took time away from paid work to fulfill caregiving responsibilities. However, the most important, overarching limitation was that the benefit and leave, like the others, is exceptional, only available in the direst circumstances. Once the infectious disease emergency ends, protected leaves will cease, the CERB likely will end and we will return to the status quo ante.

IV. GIVING WORKERS WHAT THEY ARE OWED: PRINCIPLES AND POLICY OPTIONS TO GUIDE THE DEVELOPMENT OF THE SICKNESS AND CAREGIVING BENEFITS

Thus far, we have argued that prior to the COVID-19 pandemic, the sick and caregiving leave and benefit regime was only a partial response to the need to provide workers with income security adequate to enable them to take time off work to recover from illness and injury and to participate in the multitudinous activities of social reproduction. Moreover, the partiality of that regime was not evenly distributed; rather, its limitations disproportionately affected women, racialized workers, workers without legal status in Canada and other groups congregated in the most precarious jobs and vulnerable social locations. The COVID-19 pandemic made the inadequacy of the regime particularly glaring, requiring governments to enact emergency measures to provide workers with greater access to income security so that they could, inter alia, take time off work to protect their health, recover from sickness and to care for family members.

We have also pointed to the limitations of these emergency measures but, most importantly, they are temporary so that we will revert to the pre-existing regime with all its limitations when the emergency ends.

By way of conclusion, we address the question of what we owe workers as a matter of common humanity. In order to begin to answer this question, we have to face an issue we have avoided to this point: the principles that we believe should guide us. Hence, this is where we will begin. However, we also recognize that our guiding principles -- which we conceive as a package, that is, to be respected simultaneously, often lead us to a wholesale rejection of the existing regime, which is not in the offering for the moment. Thus, we also feel compelled to speak to the political possibilities of our time, a time when certain meaningful reforms to that regime, which may not have been possible before the pandemic, are potentially within reach. Therefore, we begin with suggestions to reform the existing regime in ways that we hope would bring some amelioration to those who currently are most adversely affected. We conclude briefly with some thoughts about the kinds of arrangements our common humanity truly requires if sickness and caregiving are to be recognized as normal features of the human condition, rather than exceptional circumstances.

A. PRINCIPLES

In thinking about the principles that should inform how we think about what we owe workers to enable them to have time away from paid work for sickness and caregiving, we have identified four.

1. UNIVERSALITY

We start from the premise that, at a minimum, all workers engaged in paid work are liable to become temporarily ill or disabled and that they have caregiving responsibilities. The scope of potential entitlement flowing from this principle extends in several related directions.

First, a sickness and caregiving regime must be available to all paid workers, regardless of their status as employees or independent contractors or their status in Canada as citizens, permanent residents, migrants or undocumented workers. As well, universality dictates that all paid workers be eligible to secure the regime’s benefits regardless of the number of paid hours they have worked in the past year or the duration of their contract with their current employer(s).

Second, the premise of universality, as applied particularly to caregiving, requires that workplace and institutional arrangements be based on the assumption that everyone has important caregiving responsibilities and the
requirement that these be shared equitably within and often between households and across communities. Central to this principle is the de-gendering of care so that it ceases to be constructed as women’s (unpaid) work. This assumption lies at the foundation of what Nancy Fraser has aptly described as the Universal Caregiving model and Eileen Applebaum’s parallel conception of “shared work and valued care.” It is also central to as other compatible conceptions, such as working towards global Universal Caregiving that seek to expand the notion of community membership towards denationalizing access to social and labour protections to address the situation of migrants. While caregiving leaves and benefits might be a part of the design of such a model, much more would be required for its realization. Nevertheless, universality must be at the core of leave provisions.

2. SUFFICIENCY

The principle of sufficiency requires that when workers are required to take time to attend to their own illnesses or to provide caregiving to others, they are provided with sufficient benefits to avoid poverty and exploitation. Sufficiency also requires that the true costs of social reproduction are recognized so that capital and the state cannot free ride on unpaid labour, performed principally by women and social groups long marginalized in the labour force (e.g., older workers, recent (im)migrants living in multigenerational households etc.) This principle is particularly important for the lowest income earners who simply cannot afford a reduction in income given their baseline income and their lack of savings to fall back on.

78. For a discussion of scholarship gesturing towards this model, see Leah F Vosko, Managing the Margins (Oxford University Press, 2010).
3. SECURITY

The principle of security requires that workers should not lose their jobs or contracts because of taking time off for sickness or caregiving. The application of this principle to the varied situations to which it would apply may be complicated because of the universality principle. Nevertheless, a sickness and caregiving regime must seek to maximize the security it provides.

4. WORKER-CENTRED FLEXIBILITY

The principle of flexibility requires that we recognize that the need for time for sickness and caregiving is going to vary substantially between workers and that workers need flexibility to make arrangements that are suitable to their situation. For example, while some sicknesses are short-term and one-off events, others are chronic and episodic. Sickness regimes must be able to accommodate the different needs generated by these conditions. Similarly, the requirements of caregiving and the situation of caregivers will vary enormously. For example, childcare and eldercare will be both ongoing and episodic in its demands, and the resources available will differ substantially depending, for example, on whether there is more than one caregiver involved.

B. APPLICATIONS: REFORMING THE EXISTING SICKNESS AND CAREGIVING BENEFITS AND LEAVE REGIME

We can think about the application of these principles at two levels. At one level, we may conclude that the current regime cannot be adequately reformed to provide workers what they are owed as a matter of common humanity—namely, that a regime change is required. This is arguably the case for caregiving leaves and benefits although not necessarily for sickness. At another level, even if we conclude that regime change is necessary, the application of these principles to the existing regime can produce some amelioration or incremental changes in a transformative direction. Therefore, in what follows, we talk principally about changes to the existing regime and conclude by affirming the need for imagining an alternative regime built upon the foundation of these principles, rather than tweaked by their partial consideration.

1. SICK LEAVES

We have identified multiple gaps in the current regime particularly related to its lack of universality, the insufficiency of benefits, and gaps in security. We have said less about the issue of flexibility, but we will identify some reforms here to
address shortfall in that regard. As we have seen, the benefits regime is far from universal. Collective agreement and employer provided benefits are available to less than half the workforce; EI claimants must have six hundred hours of paid employment in the previous year; self-employed workers are only eligible if they have registered, paid premiums for at least one year prior to their claim and earned at least a defined minimum income during the previous calendar year ($7,279 in 2019).

There are limitations to what can be done to expand universality within the limits of a regime that is funded by employer and worker contributions as it would be difficult to build in coverage for those who have not contributed or who have limited contributions because of a lack of hours or length of registration. Nevertheless, it is important to emphasize that separation from employment due to sickness, or for that matter, to fulfil caregiving responsibilities, is distinct from other forms of unemployment. Consequently, there is nothing magical about the existing contribution requirements, and these could be reduced significantly. For example, instead of six hundred hours, employees could be required to have 360 hours of insurable earnings, as demanded by workers’ rights advocates pre-COVID 19—and one that might be reduced to three hundred in the face of a force majeure, such as a global health pandemic, as workers’ advocates have also argued. The eligibility requirements for self-employed workers should be reduced accordingly to make the benefit more accessible, and contributions should be made mandatory for all self-employed workers. Finally, the federal government could be required to contribute to the insurance fund, funded through a progressive tax system, to cover deficits resulting from expanded eligibility. The federal government fully funds the CERB, setting a precedent for such an arrangement.

The existing regime also fails on the principle of sufficiency. Eligible workers are entitled to 55 per cent of their average weekly insurable earnings, up to a current maximum of $573, although those with a family income $25,921 or less are eligible for the highly problematic family supplement. Only a minority of workers receive the maximum and many, if not most, low-wage workers will find

79. Advocates base this number on twelve weeks (the pre-1996 minimum entry requirement) multiplied by thirty hours as thirty has represented the average actual hours for hourly paid workers for many years now, although this number is somewhat less for hourly paid workers in the service sector. See “Employment, average hourly and weekly earnings, and average weekly hours by industry, monthly, seasonally adjusted” (21 June 2020), online: Statistics Canada <www150.statcan.gc.ca/t1/tbl1/en/tv.action?pid=1410022101> [perma.cc/7Z8V-RWG5]. This is nevertheless a concession as the hours-equivalent pre-1996 was lower, amounting to 180 hours (twelve weeks multiplied by fifteen hours minimum).
themselves with benefits leaving them well below recognized poverty lines. Again, using the CERB as a precedent, a minimum of $500 after tax income per week (a $573 benefit before taxes), adjusted annually to the rate of inflation to keep apace with change, might be a starting point, with graduated earned income-based deductions following. However, this level of benefits would still leave recipients in dire economic circumstances, especially if they are unable to work for the entire benefit period (fifteen weeks).

Another gap in relation to sufficiency is the one-week waiting period for benefits. This could be addressed in one of two ways, both within the limits of the regime. First, the waiting period for EI could be abolished. If that was done, and the regime was truly universal, there would be no need for employer-funded sick leaves. However, since reform at that level is unlikely, we need to build in a role for employer-paid sick days. Historically, Canadian governments at a variety of levels have strongly resisted such measures. Currently, employees in only two provinces (Prince Edward Island and Quebec) and federally-regulated employees are entitled to employer-paid sick days. Moreover, the entitlements are minimal: federal (three days); Quebec (two days) and PEI (one day and only after five years with the current employer). Nevertheless, so long as we do not have universal social insurance to cover sickness, it is essential that employers be required to shoulder some of the responsibility. The federal government and worker advocates have called for ten days of employer-paid sick leave, a measure that we too endorse.80

Still another gap in sufficiency, tied also to flexibility, relates to the maximum duration of sick leave. As it takes many workers with serious illnesses longer than fifteen weeks (which amounts to under four months for those that are full-time) before returning to work, it would be advisable to extend benefits to fifty weeks as advocated by workers’ advocates as well as the Liberal party pre-election.

With regard to security, currently only employees enjoy protected unpaid sick leaves, leaving the self-employed with no protection. Admittedly, designing security for truly self-employed workers is not a simple task, but some protection against contract termination because the worker is unable to perform work because of sickness should be considered. But even employees receive very limited security. Ontario’s ESA, for example, only provides for three days of protected unpaid sick leave. After that, an employer can terminate a sick worker by giving notice, although in some cases workers might receive additional protection

against termination from human rights codes that prohibit discrimination on the basis of disability. Provincial employment standards laws should be amended to provide protection of job security to match the length of time for which federal benefits are available.

Finally, the current regime fails to live up to the requirement of worker-centred flexibility. Although EI permits workers to continue to reduce their hours of work and still collect sick leave, the regime is not responsive to workers with chronic episodic conditions who may take numerous short leaves in response to changes in their day-to-day health status. Similarly, the leave protections are far too short to address these situations. Although human rights laws require employers to accommodate workers with disabilities to the point of undue hardship, there are limits to those accommodations and, in any event, accommodation does not require employers to provide paid leaves beyond whatever employer-provided benefits might be available.

2. CAREGIVING

With respect to caregiving leaves and benefits, to promote universality, there is a fundamental need—which predates the state-of-emergency, albeit exacerbated by the global health pandemic—to expand the scope of caregiving leaves to address caregiving needs beyond those of critically and/or terminally ill adults and children. To address the mounting crisis in social reproduction, caregiving leaves must enable workers, whether they are employees or self-employed, to fulfil caregiving obligations of other sorts, including, but my no means limited to, caring for a chronically ill or disabled child or adult. In this instance, Ontario’s Family caregiver leave offers a preferable model to Compassionate and Caregiver benefits under EI as it provides protected leaves to care for those with serious medical conditions, without a significant risk of death. Even broader in its scope is Ontario’s very limited Family responsibility leave, which provides protected leaves to provide care in the event of an “illness, injury or medical emergency” or for “an urgent matter.”

There is also a need to expand the range of relationships for which caregiving benefits and leaves are available. Although the current scheme contains an open-ended provision that covers caregiving for “a person who considers the employee to be like a family member,” this might preclude drawing on broader networks of support in a time of need.

Alongside expanding the scope of caregiving for which benefits and leaves are available, and also in the interest of universality, it is necessary to reduce entry requirements along the lines of what we propose with respect to EI sickness
benefits. This reduction is required to bring the precariously employed and social
groups long marginalized in the labour force (e.g., older workers, recent (im)
migrants living in multigenerational households etc.), two groups which overlap,
into the fold. As we argued, the six hundred-hour threshold for qualification
for employees, and the twelve-month waiting period (together with a minimum
income from self-employment) for the self-employed, are too onerous. They
simply make these leaves inaccessible to workers most in need of the benefits they
offer. So, too, is the one-week waiting period for receipt of benefits, especially
for those engaged in low-wage work, which also diminishes the sufficiency of
such benefits. Why not, therefore, as we suggest with respect to sick leave, make
contributions into all special benefits mandatory for all workers, eliminating
the need for a twelve-month waiting period for self-employed workers opting
to self-insure, and institute a uniform 360-hour qualifying requirement for
employees and an equivalent minimum amount of insurable income for the
self-employed workers?

We have already discussed the insufficiency of special benefits in the context
of sick leaves. The problems are similar for caregiving. As with sick benefits,
caregiving benefits must clearly increase. Standing at 55 per cent of best weekly
income up to a specified maximum (plus a low-income supplement for eligible
claimants in low-income households), the prevailing level of benefits makes
taking this leave untenable for many workers that manage to qualify, especially
the precariously employed. This benefit should be replaced by a flat rate benefit
akin to that proposed above for Sick Leave. Creating a universal level of benefits
would go a long way towards improving access and equity in benefit entitlement.

With regard to security, we have previously noted that provincial job security
provisions and federal income supports for caregiving are in much better synch
than is the case for sickness. Still, employment standards laws do not cover
self-employed workers and thus they do not enjoy any contract security even if
they are entitled to EI caregiving benefits, although as we acknowledged, care
is needed to design such protections. We also noted the mismatch between
entitlement to Family caregiver EI benefits and statutory leave rights in Ontario.
This disjunct can be rectified easily by removing the requirement that to access this
leave workers must have been employed for six months by their current employer.

Caregiver leaves, moreover, need to take on board and develop further
the principle of flexibility, already established under existing caregiver leaves,
of allowing for multiple caregivers. They also need to provide for greater leeway
in how they are taken up. For example, in the return to “normal” after the first
wave of the global pandemic, daycares and schools are running on different
schedules with reduced contact hours, calling on parents, caregivers and other community members to engage in greater caregiving alongside paid work in new and complex ways. In response to changing gender, household, and community norms, the notion that care recipients and caregivers must, at a minimum, have a “family-like” relationship should likewise be abandoned—which would obviate the need for formal attestations of “family-like” relationships.

Also, to further facilitate caregiving by multiple individuals, that is, across the generations and genders and across communities, a desirable equity objective tied to the normative objective of universal caregiving, the requirement that workers demonstrate that their regular weekly earnings from employment have decreased by more than 40 per cent for at least a week due to caregiving responsibilities should likewise be reduced or eliminated. For the precariously employed, enduring a 40 per cent reduction in what are often exceedingly low weekly earnings from employment is difficult to sustain—even for a week. Such a change would also address the principle of sufficiency.

V. IN LIEU OF A CONCLUSION: CONSIDERING OUR COMMON HUMANITY

Having laid out a menu of options for changing the existing sickness and caregiving regimes within the horizon of possibility, imagining transformative alternatives built upon the principles of universality, sufficiency, security, and flexibility is clearly necessary. Although our project herein has entailed a critical evaluation of these regimes towards their amelioration, having now undertaken this exercise we are convinced of the inherent limits of models of entitlement for leaves and benefits created within a narrowly profit-driven system in which government is routinely pressed to give priority to cost-containment over fairer and more equitable social and economic arrangements. Within such narrow confines, prevailing leaves and benefits are, of necessity, premised on exceptionalism—cast falsely as accommodations—as though responsibilities for care are aberrations rather than ongoing in workers’ everyday lives across the lifecycle and the requirement for sick leave is a rarity that few workers will confront. In this context, sick leave and benefits represent the most normalized exception. Yet, even here, workers taking sick leave are often stigmatized and the validity of their disablement from work doubted. Moreover, most workers do not have access to short-term paid sick leave. The most socially acceptable and financially supported sick leaves are for grave illness or injury and/or significant risk of death. Among caregiver leaves, the analogue is the Compassionate Care
sub-regime, which assumes the imminent or likelihood of death of the care recipient. That is, as a society, we imagine only the most horrific life circumstances allowing for legitimate time away from paid work, i.e. necessitating support that is less than sufficient and security that is less than full.

It is nevertheless possible to design and implement high-quality public provisions for caregiving funded through both social insurance and a more progressive tax system. In more ideal circumstances, on the one hand, moving in this direction would entail, in the case of caregiving, enabling workers to move more freely within and between vital and socially-necessary activities, such as, but my no means limited to, child and elder care, vital to social reproduction -- activities that we should all be encouraged to engage in to the best of our abilities. On the other hand, equally, and arguably more fundamentally, as the global pandemic illustrates vividly, it would entail extensive public supports for caregiving delivered in the public sector (by well-paid public sector workers).

Presently, nowhere is the case clearer than in the long-term care sector.81 Yet the enduring case for high quality publicly-provided care for children—both preschool and school-aged—is equally compelling, especially with the developing “she-session.” In both instances, no less is required than flexible (in terms of its availability at different intervals and in different settings) and sufficient (in terms of caregiver to care-recipient ratios, adequate personal protective equipment et cetera) child and elder care, that is universally accessible and that secures workers’ jobs, including the jobs of (the) precariously employed women, (im) migrants, youth and older workers already marginalized in the labour force that staff both domains.

VI. POSTSCRIPT: AFTER THE CANADA EMERGENCY RECOVERY BENEFIT

As of December 2020, COVID-19 case numbers continued to grow across Canada, and states of emergency and public health restrictions continued or increased in all jurisdictions. While effective vaccines now exist, it will likely take

at least another year until a majority of people in Canada have been vaccinated, and the economic, social, and cultural impacts of COVID-19 will undoubtedly last much longer. It nevertheless remains to be seen which, if any, of the temporary modifications to income security programs will become a permanent feature of Canadian policy. The federal government discontinued the CERB at the beginning of October, 2020, and made temporary changes to the EI program as well as offering three options for non-EI transitional benefits which remain in place at the time of writing. In terms of the changes to EI, the interim changes include providing an insurable hours credit to all applicants (300 hours for regular benefits, 480 hours for special benefits), establishing a single minimum unemployment rate of 13.1% across Canada for all applications setting aside the VER, and increasing both the minimum eligible weeks for benefits (to 26 weeks) and the minimum benefit rate (to $500 per week), as well as removing the requirement for a medical certificate for sickness benefits. After the CERB was discontinued, there was a surge in EI applications, with a significant increase in the proportion of women applicants relative to February, 2020, before emergency orders were in effect -- indicative of the pressing need for benefits to address persisting sickness and caregiving needs.

There are three programs currently available to people who do not qualify for EI. The Canada Recovery Benefit (CRB) is available to those whose average weekly employment or self-employment income was reduced by at least 50% due to COVID-19. The CRB provides $1000 pre-tax for each two-week period in which an individual qualifies up to a maximum of 26 weeks, and it requires a fresh application for each two-week period. In a similar vein to regular EI benefits, CRB recipients must seek work, not leave a job voluntarily, and not turn down reasonable work. The Canada Recovery Caregiving Benefit (CRCB) provides $500 per week to those unable to work at least 50% of their scheduled work week due to childcare obligations arising from COVID-19-based disruptions, or to care for a person who is sick with COVID-19, self-isolating, or at risk of serious health complications if they get COVID-19. Indicative of the ongoing impact of COVID on caregiving responsibilities, since its inception at the end of September to the time of writing, an average of slightly less than 150,000 applications have been approved each week, and, not surprisingly,

---

women constituted approximately three-fifths of all applicants. The CRCB is also available for a maximum of 26 weeks, and requires re-application each week. Finally, the Canada Recovery Sickness Benefit (CSRB) is available to those unable to work at least 50% of their scheduled work week due to self-isolation arising from having COVID-19, being under advice to self-isolate, including by reason of an underlying health condition. This benefit provides $500 per week and is available for a maximum of two one-week periods in total. The number of approved applications for this benefit, for which a higher proportion of men than women apply, declined, from a slightly less than 70,000 a week, when the program began to under 30,000 in the first week of December. All three benefits are available until September 2021, and all treat employment and self-employment equally in terms of eligibility requirements, which include a minimum level of earnings in a year preceding their application ($5000 from employment, net self-employment, or maternity or parental EI benefits).

The temporary changes to EI undoubtedly make it more accessible: they provide improvements in terms of eligibility, broadening the scope of protection somewhat, but represent neither structural nor permanent change to the EI system. The temporary programs replacing CERB provide a similar level of benefit, but are likely to narrow the scope, with more specific eligibility requirements, ongoing re-application requirements, and variable duration (including a maximum of two weeks in the case of sickness benefits). While they continue to fall short of what we owe workers in terms of the principles we have set out, the application of these programs against the backdrop of COVID-19 is poised to provide compelling evidence for the need to take account of illness and caregiving as permanent, rather than exceptional, components of the lives of workers and to deeply reimagine the policies through which we do so.
